

VOORJAARSSYMPOSIUM

Belgian Academy of Paediatric Dentistry

Thema: Late complications in traumatology: how to fix them

29 - 03 - 2025

Holiday Inn Brussels Airport

8:30 - 9:15 Onthaal

9:15 - 15:45 Lezingen, inclusief lunch en koffie break

Lezing 1

Frans

"Ankylose traumatique et non traumatique : Le point de vue de l'Orthodontiste."

À travers différents cas cliniques et situations concrètes, associés à une analyse approfondie de la littérature existante, l'ankylose traumatique et non traumatique (Défaut d'Éruption Primaire ; DPE) sera explorée.

Prof. Dr. C. Charavet

Ces problématiques se positionnent en véritable défi, nécessitant un diagnostic précis et différentiel (DPE versus Ankylose) ainsi qu'une prise en charge - souvent multidisciplinaire - impliquant une planification rigoureuse des différentes étapes.

Prof. Dr. M. Le Gall

Lezing 2

Engels

"Paediatric Maxillofacial Trauma."

Paediatric facial traumatology is not handled as the adult patients. Children are uniquely susceptible to cranio-maxillofacial injury due to their cranial mass-to-body ratio. Soft-tissue injuries are relatively common, and include contusions, abrasions, lacerations, and burns.

Children sustain a small portion of reported facial fractures peaking in adolescence. Falls and sport are the most frequent aetiology.

Evaluation of the paediatric trauma patient will be explained as performed in our level I trauma centre. Goals of treatment should be prevention of infection, restoration of function and measures to minimize scarring and secondary deformity. Regarding wound management, eg dog bite wounds, the primary suture must be done, with the minimal

Prof. Dr. P. Mahy

Regarding bone trauma, functional treatment is prioritized in children to avoid growth disorders and potential damage to the dental germs. The author will illustrate the literature review and guidelines with cases treated in his department.

Lezing 3

Engels

"Restorative treatment options for Traumatic Crown Fractures: A Masterclass for Pediatric Dentists"

Esthetic management of fractured young permanent incisors using resin-based restorative materials has become a viable treatment option with predictable long-term clinical success. This two-hour, comprehensive masterclass will first review the current adhesion strategies for bonding to enamel and dentin, and the importance of isolation, and will then focus on the two most-frequently encountered post-trauma consequences: Fragment reattachment and Class 4 resin-based restorations. Fragment reattachment procedures will be demonstrated in a variety of clinical scenarios including crown fractures that require various grades of pulpal management, late referral cases with crown displacement, shade selection strategies and correct fragment alignment techniques in a pictorial, step-by-step format. For Class 4 composite restorations, the

Prof. Dr. Z. Cehreli

principles of shade selection, layering techniques, morphology and polishing techniques will be demonstrated on several simple to complex case presentations.
